<HTML\>

- Dictates the overall structure of a webpage
- Useful to think of as in nested containers

Overview	Page 3
Design Objectives	Page 4
Moodboard	Page 5
Logo Reveal	Page 6
Fonts & Colors	Page 10

What are these “containers”?

container / “element”

```
<span> Yippee </span>
```

opening / closing tags

- defined by “tags”

- can even contain other containers

```
<div>
    <span> Yippee </span>
    <span> Yippee </span>
</div>
```

parent element

child elements

cont.

- different tag names lead to different behaviors
  - ex. displaying text

<h1> Yippee </h1> → Yippee

h_ -> “header” text will display larger than normal
the number after the h dictates the text size (1 is largest, 2 is smaller, etc.)

---

p “paragraph” text
good for dictating blocks of text

Yippee ← Yippee

cont.

- ex. displaying images

```
<img href="yippee.png"/>
```

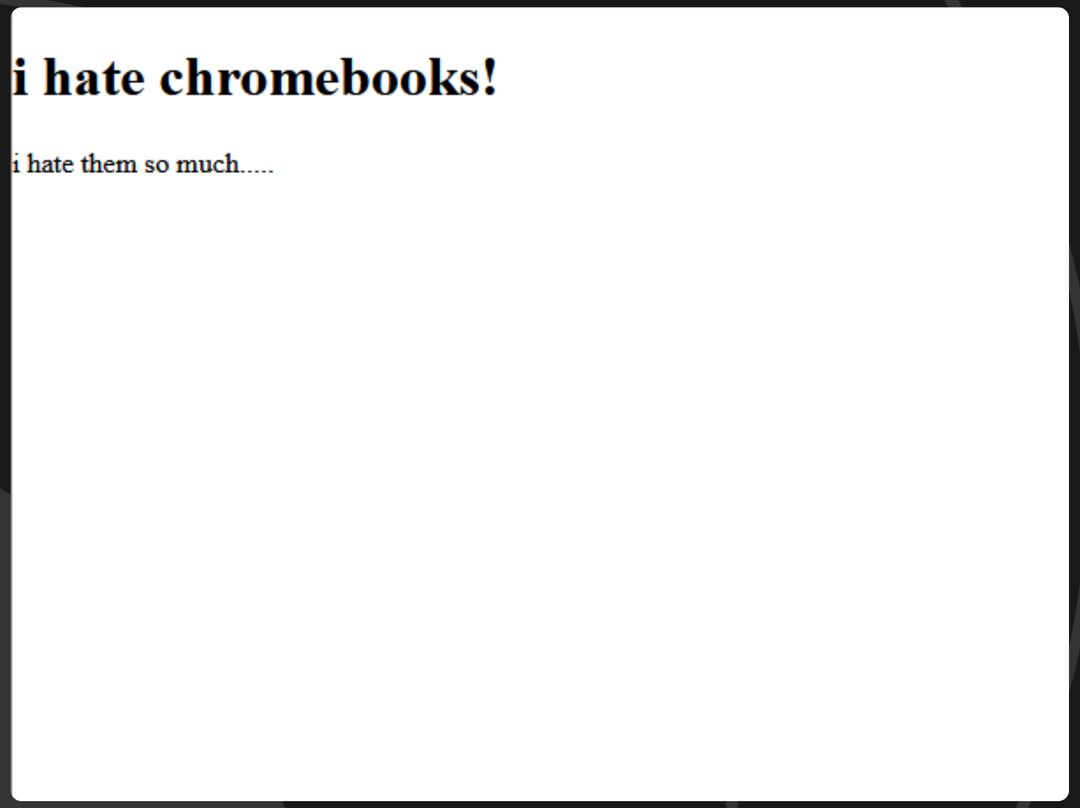
- !!the “img“ tag is <u>self-closing</u>, which means the tag closes by itself and thus does not need closing tags
  - images do not need to have text inside of it like the “h1” or “p” elements do
  - syntax is like an opening tag but with a <u>backslash</u> before the last angle bracket

- URL of desired image in the “href” attribute
  - attributes will be discussed farther into the school year

bare-bones HTML

```
<html>
    <head>

    </head>
    <body>
        <h1>
            i hate chromebooks!
        </h1>
        <p>
            i hate them so much.....
        </p>
    </body>
</html>
```



what the flip are the html, head, and body tags?

```
<html>
    <head>
    </head>
    <body>
    </body>
</html>
```

tells the computer to start building the HTML webpage

holds information about the page that isnt visible to users (title, info for web crawlers) as well as other utility files

holds information visible to users (text, paragraphs, images, videos)

useful to analogize the HTML structure as a person

- head
- body

some other useful HTML tags

...

“division” tag

- meant for structure

a tag that doesnt do anything, but purely to help “divide” your webpage into structured pieces

<a href=”fullstack.nexus”>
click on me!
</a>

click on me!

“anchor” tag

- hyperlinks

creates a hyperlink that redirects to the link in the “href” attribute with the text inside

optional: basic About-Me page

apply the things you just learned in your first project!

name: Duck

i like to duck and coffee and santa. frick you if you think santa is fkae.
