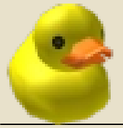
FULL-STACK NEXUS

hello!!!!!!!!!!!!!!!!!!!!!!!!!



9/??/24

FSN

What is JavaScript?

- a programming language that provides functionality to websites
  - add behaviors to buttons, keyboard inputs, etc.
  - extremely flexible
- used in <u>every</u> website that has some sort of user interaction with the webpage

But first...

declaring variables:

```
const number_1 = 5; //constant variable, cannot be changed
let number_2 = 6; // mutable variable, can be changed

number_2 = 9; //will work fine
number_1 = 8; //will throw an error
```

```
Uncaught TypeError: invalid assignment to const 'number_1'
    <anonymous> debugger eval code:8
  [Learn More]
                                                  debugger eval code:8:1
```

basics cont.

logging to the console/terminal:

```
const number_1 = 5; //constant variable, cannot be changed
let number_2 = 6; // mutable variable, can be changed

number_2 = 9; //will work fine

console.log(number_1); //will output 5
console.log(number_2); //will output 9
```

```
5
                                    debugger eval code:8:9
9
                                    debugger eval code:9:9
```

basics cont.

basic math stuff:

```
const number_1 = 5; //constant variable, cannot be changed
let number_2 = 6; // mutable variable, can be changed

number_2 = 9; //will work fine

let number_3 = number_1 + number_2;
console.log(number_3); // will output 14 (5 + 9)

number_3 = number_3 * 2;
console.log(number_3); // will output 28 (14 * 2)

number_3 = number_3 / 7;
console.log(number_3); // will output 4 (28 / 7)
```

```
14
        debugger eval code:9:9
28
        debugger eval code:12:9
4
        debugger eval code:15:9
```

functions!!!

Task: try creating a function that returns a number that is 5x the input

making a function to repeat actions

```
function add_3( number ){
    const new_number = number + 3;
    return new_number;
}
console.log( add_3(5) ); // will output 8 (5 + 3)

let number_4 = 5;
number_4 = add_3(number_4);
console.log(number_4); // will output 8 (5 + 3)
```

functions!!!

Task: try creating a function that returns a number that is 5x the input

using multiple parameters(inputs)

```
function add_together(number_1, number_2){
    return number_1 + number_2;
}

console.log( add_together(5, 7) ); // will output 12 (5 + 7)

let a = 5;
const b = 6;
a = add_together(a, b); // a will be 11 (5 + 6)
a = add_together(a, b); // a will now be 17 (11 + 6)
console.log(a); // outputs 17
```

Strings (text)

Declaring strings:

```
const text = “today is taco tuesday!”;
console.log(text); // outputs today is taco tuesday
```

```
today is taco tuesday
                    debugger eval code:2:9
```

Concatenating (combining) strings:

```
const detail = “ i love taco tuesday so mcuch!”;
const new_text = text + detail; // concatenates the two strings
console.log(new_text);
```

```
today is taco tuesday! i love taco tuesday
so mcuch!
                    debugger eval code:9:9
```

Arrays

- lists of elements

Declaring arrays:

```
const colors = [];
colors.push("red"); // adds "red" to the colors array
colors.push("blue");

console.log(colors[0]); // accesses the first element ( 0-indexed )
// outputs red
console.log(colors[1]); // accesses the second element
// outputs blue
console.log(colors); // prints the whole array
console.log(colors[0] + " " + colors[1]); // outputs red blue
```

whitespace

```
red
                    debugger eval code:5:9
blue
                    debugger eval code:7:9
▶ Array [ "red", "blue" ]
                    debugger eval code:9:9
red blue
                    debugger eval code:10:9
```

Arrays

- cont.

looping over elements:

```
red
                    debugger eval code:4:11
blue
                    debugger eval code:4:11
green
                    debugger eval code:4:11
```

```
// a way to declare arrays preset with values
const colors = ["red", "blue", "green"];

colors.forEach( function( color ) {
  console.log(color);
});
// loops over every element and acts upon them using the function
declared inside
// for each item in colors (used as a parameter "color" in the
inside function), log it to the console
```

Questions?

thx for coming!

Typography

Having a signature font contributes to a strong brand. It is considered as a visual component and should be consistent throughout.

Typography guidelines:

- Select a font for the logo and heading
- Select a font each for subheadings and body font. Note that these fonts can be the same, but can vary in size or style.
- Assign a standard size for the use of each
- Keep fonts simple and clean

Heading

Please type here the font size & style (italics, bold, etc) you used

Subheading

Please type here the font size & style (italics, bold, etc) you used

Body

Please type here the font size & style (italics, bold, etc) you used

Photography

Photographs are a great way to show life at the school. This can be photos of students in action, the teachers and staff, as well as activities or events. To provide consistency, all photos will be provided by the school.

Photography guidelines:

- Please use the whole photo as much as possible and do not crop.
- All photos have already been through post-processing.
- Do not flip the photos.
